

Challenges:

The piling industry depends heavily on machine power to handle on-site tasks, with these machines predominantly reliant on diesel for power. Emmess Ltd ensures its machinery remains up to date with site requirements through continuous investment. The company remains vigilant of future developments and requirements, allowing it to make informed decisions regarding equipment choices moving forward.

Impact:

Engaging with the School has been highly informative for Emmess Ltd. As an SME, the company previously lacked awareness of its sustainability practices in a comprehensive manner. However, upon engaging with the school, Emmess Ltd was surprised to realize the extent to which it had been subconsciously contributing to sustainability efforts. For instance, the company recycles all of its waste, ensuring nothing goes to landfill. Additionally, all received boxes are recycled into packaging for consumable orders, and Emmess Ltd also recycles 1000 litres of rainwater per use, weather permitting.

Resources:

Assessments – The assessment process enables Emmess Ltd to reflect on its current position as a company and educates everyone about the gaps in the business where improvements can be made.

Action Plan – The action plan has proven to be very helpful for Emmess Ltd, educating the company both presently and for the future. It prompts thought and realization about where improvements can be made.

E-learning modules – Emmess Ltd has found the e-learning modules easy to navigate and very informative, aiding in the planning for the future with education and development around sustainability.

Value gained:

Emmess Ltd will be staying with the School, recognizing the value it provides in helping them gain the knowledge required for the future. Competition will always be a part of business, and the school will help everyone stay up to date with what is happening in the world. This will aid in educating and keeping on top of changes, ultimately driving the business forward toward a more productive and sustainable future for all.
